SpareTokens

Private pilot. Not yet public.

SpareTokens for teams

Put the AI budget your company or lab already has toward verified open science. Your keys stay on your machines, and every result is checked before it counts.

Why teams use it

Spend the AI budget you already have Point unused credit at open problems, under a cap you choose.

Verified open science Every result is re-checked by code we own. Known values and known status so far.

Something you can show Team leaderboard and impact report are planned, not built. A pilot gets a short written summary.

What we need from you

- One person who owns the pilot, and one reviewer for security.
- A project or service-account key with a spend limit, and a cap you are comfortable with.
- One to five machines, or local models on hardware you own.
- Your consent for how people appear. The default is a username, never a real name.

How it is safe

Keys never leave your machines The worker runs on your machine with your own key. No tool or endpoint accepts a key.

Hard caps Per-task and per-day caps are checked on the machine before each task.

Signed tasks and a public log Every task is signed and in a public log. The worker verifies before it runs anything.

Narrow by design Fixed task types, fixed tools, a sandbox with no network.

Provider terms respected API keys and local models only. A dedicated project key with its own limit is recommended.

How a pilot works

1. **You email us.** Your organization, who owns the pilot, your providers and the monthly spend you would cap.
2. **We agree scope and caps.** One to five machines or keys, the caps, the task types and the hours. Your security reviewer gets the summary first.
3. **You set up the first machine.** A dedicated project key, the worker, a giving rule and a preview. About 30 minutes, following the team guide.
4. **You see a first verified result.** Then you decide whether to roll out to more machines, pause or stop.
5. **We write it up with you.** A short summary: tasks run, results verified, reported spend and anything that went wrong. Nothing is published without asking you.

What you get

- A verified result from your own team, and a record of what ran and what it cost.
- Access to the public task log and the signed task, so your reviewers can check the claims themselves.
- A written summary at the end, and a direct line to us.
- Planned, not built yet: a team page, a team leaderboard, organization controls and an automated impact report.

Pricing. There is no price list yet. A pilot costs you the API spend you cap, and we agree anything else in writing before it applies.

Plainly

No customers and no discoveries are claimed. We hold no SOC 2 or ISO 27001 certification. Consumer subscriptions are not supported. An external review of the worker sandbox is planned before the public beta.
